

PATIENT

Mola Biederbeck

SPECIES

Canine

BREED

Labrador

SEX

Spayed female

AGE

8 years

WEIGHT

31.5 kg

PRESENTING CLINICAL SIGNS

This is my own dog and her spleen palpates as enlarged so u/s today. Clinically normal, all bloodwork normal. Is on thyro tabs long term. No weight loss. Abnormal PE/Chem/CBC/UA Results: All normal.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Spleen

The **spleen** presented subtle, heterogenous, parenchymal changes with an isoechoic 1.0 cm nodule at the caudal pole. No capsular expansion was noted. The presentation is most consistent with nodular hyperplasia.

ULTRASONOGRAPHIC FINDINGS

Likely nodular hyperplasia in the spleen with mild potential for round cell neoplasia or emerging hemangiosarcoma.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I recommend FNA as a baseline especially if any weight loss is present. The spleen should be monitored in approximately 2-3 weeks for any progression. If any progression occurs over the next 2-3 weeks then proactive splenectomy is indicated.
