PRESENTING CLINICAL SIGNS

Eating on and off for 3 weeks. Owner is forcing patient to drink water via syringe. Owner was giving Pedialyte. Patient was given 7 day dewormer 2 days ago.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex. The capsules were acceptably uniform without significant irregularities. Left kidney measured 6.8 cm with slight pyelectasia noted. The right kidney measured 6.5 cm.

Adrenal Glands

The **left adrenal gland** was flattened and isoechoic, measuring 1.8 cm x 0.20 cm, strongly consistent with Addisonian adrenals.

The **right adrenal gland** was also flattened and isoechoic, measuring 1.56 cm x 0.50 cm at the cranial pole and 0.25 cm at the caudal pole.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

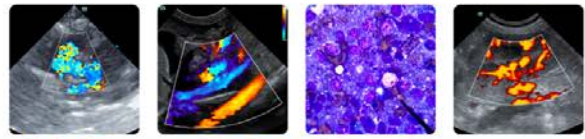

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** was thickened up to 1.2 cm with multifocal hyperechoic mucosal inclusions suggestive for ulcerative gastritis. Minor amount of fluid filled lumen noted. The pylorus was patent yet mucosal remodeling was noted. The small intestine and colon were unremarkable.

Pancreas

The **pancreas** was prominent, hypoechoic and irregular.

SEX

Spayed Female

AGE

2 Years

WEIGHT

15.3

ULTRASONOGRAPHIC FINDINGS

- Flattened adrenal glands
- Ulcerative gastritis pattern.
- Prominent pancreas, potential low-grade inflammation.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recommend full workup for Addison's, GI protectant protocol, and supportive care. No evidence of neoplasia or foreign bodies.
