PRESENTING CLINICAL SIGNS

History: Hx of splenic hemangiosarcoma- had splenectomy. Is on turkey tail and yunnan baiyao. Gets recheck u/s and rads every 6 weeks or so.

Abnormal PE/Chem/CBC/UA Results: PE WNL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.4 cm. The right kidney measured 6.5 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.5 cm. The right adrenal gland measured 0.8 cm at the cranial pole and 0.5 cm at the caudal pole.

Spleen

The **spleen** was not visualized as it was previously removed. The region of the splenic fossa was unremarkable. There was no return of prior pathology.

Liver

The **liver** revealed slight coarse architecture, similar to the prior sonogram. Minor, heterogenous parenchyma was noted without cavitation or disruption of architecture. The gallbladder was unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Retention of ingesta was noted in the stomach. Small and large intestine demonstrated normal luminal chyme and stool consistency

PATIENT

respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Bodhi Sipala

SPECIES

Pancreas

Canine

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Labrador

ULTRASONOGRAPHIC FINDINGS

SEX

Mild hepatic remodeling. Similar to the prior sonogram.

Neutered male

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

AGE

There was no return of prior splenic pathology and no evidence of disease.

9 years

WEIGHT
