

**PATIENT**

Coco Sabatini

**PRESENTING CLINICAL SIGNS**

blood in urine, irregular shaped bladder on xrays possible thickened (mineralization on fast scan)  
Current Bup 0.1 ml BID

**SPECIES**

Feline

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

**BREED**

DSH

The **urinary bladder** revealed a shadowing calculus measuring 3.0 mm. The bladder wall was slightly thickened. Anechoic urine present otherwise. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction. A minor amount of sand or debris was noted in the pelvic urethra.

**SEX**

Neutered Male

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.39 cm. The right kidney measured 4.82 cm.

**AGE**

3 Years

The iliac trifurcation was unremarkable.

**Adrenal Glands**

The regions of the **adrenal glands** were unremarkable.

**WEIGHT**

17

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**Liver**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**IMAGING PERFORMED BY**

**Gastrointestinal**

**REFERRING VET**

Dr. Gannon

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**INVOICE**

26178

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**DATE**

**ULTRASONOGRAPHIC FINDINGS**

- Bladder calculus, cystitis pattern

**SPECIES**

Feline

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Cystostomy, stone analysis and culture recommended. Brief bladder ultrasound should be performed just prior to surgery to ensure the calculi are still present. Normo- and retrograde flushing recommended at the time of cystostomy. Bladder wall biopsies warranted to rule out concurrent underlying disease.
