

PATIENT PRESENTING CLINICAL SIGNS

Hermann Abate
pancreatitis constipation

SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Feline Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 1.0 cm beyond the cystourethral junction.

BREED

DSH

SEX

Neutered Male

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.78 cm. The right kidney measured 3.6 cm.

AGE

4 Years

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

WEIGHT

9.9

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

The **liver** presented slight increased portal markings. The gallbladder was unremarkable.

IMAGING PERFORMED BY

Jenn

Gastrointestinal

The **stomach** was filled with progressively shadowing material, likely hairball accumulation, measuring approximately 4.0 cm. Some reactive mesentery was noted in the mid cranial abdomen with variable intestinal thickening and fluid filled colonic lumen.

HOSPITAL NAME

Rockaway AH

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

INVOICE

26182

- Gastroenteritis presentation
- Possible minor pancreatitis

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE

10/11/21

Suspect hairball accumulation in the stomach. 24-hour NPO, broad-spectrum antibiotics, pain management and plasma expansion all indicated. Recheck sonogram in 48-72 hours if the patient si not resolving clinically.
