

PATIENT

Baron Grote

SPECIES

Canine

BREED

Golden Retriever

SEX

Intact male

AGE

3 years

WEIGHT

68.8 lbs

PRESENTING CLINICAL SIGNS

History: US done 9/9. Has been on enrofloxacin for 4 weeks
Abnormal PE/Chem/CBC/UA Results: Brucella- Negative

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The prostate has subjectively improved. The edema lines noted on the prior sonogram appear to have largely resolved. The prostatic size was 2.6 cm. There was no deviation to the descending colon was present. No pericapsular inflammation is present.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 5.26 cm. The right kidney measured 6.47 cm.

Adrenal Glands

The region of the **adrenal glands** were imaged with no evidence of pathology.

Spleen

The **spleen** in this patient was mildly enlarged with uniform parenchyma and was folded upon itself cranially. This is a positional variant and is not pathological. There was no evidence of significant disease.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

PATIENT

Pancreas

Baron Grote

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

BREED

Improved prostate, same size, yet no evidence of inflammation.

Golden Retriever

Otherwise, normal abdomen.

SEX

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Intact male

There is no evidence of pathology. If the prostate palpates normal and no significant inflammatory sediment is present in the urine then Enrofloxacin therapy can likely be ceased at this time.
