

PATIENT

Collin Herig

PRESENTING CLINICAL SIGNS

recheck bladder inflammation; doing well at home

SPECIES

Canine

LIMITED ULTRASONOGRAPHIC EXAMINATION

The urinary bladder is significantly improved compared to the prior sonogram with largely anechoic urine. Minor polypoid bladder changes noted with apical ventral and apical dorsal thickening. The urethra and prostate were unremarkable, uniform. The most dramatic thickening of the apex revealed a polyp measuring 1.5 cm in length. The bladder thickening appears resectable with eventual apical partial cystectomy. If any inflammatory sediment is present, recommend continuation of the current UTI protocol.

BREED

SEX

Neutered Male

ULTRASONOGRAPHIC FINDINGS

- Chronic cystitis with polypoid changes

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The best option is likely partial apical cystectomy with removal of the cranial third of the bladder. Underlying urachocoele may be present under the polyp present at the bladder apex.
