

PATIENT

Stella 11th Hour

PRESENTING CLINICAL SIGNS

Chronic diarrhea (better controlled now).
Temp 99.7, HR 200, RR 56, BCS 3-4/9, PS ¼, FAS green.

SPECIES

Feline

Heart I-II/VI systolic soft murmur.

BREED

Domestic Shorthair

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Spayed Female

AGE

11 years

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities.

WEIGHT

8.25 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Spleen

HOSPITAL NAME

SDEP Lab

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

INVOICE

93068

DATE

11/14/21

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT

Gastrointestinal

Stella 11th Hour

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. The mesenteric lymph nodes were reactive.

SPECIES

Feline

BREED

Domestic Shorthair

Pancreas

The **pancreas** revealed moderate echogenicity.

SEX

Spayed Female

ULTRASONOGRAPHIC EXAMINATION OF THE HEART

Rapid echocardiogram was performed. The LA:AO ratio was normal. The left atrium was normal in size. The heart revealed normal contractility.

AGE

11 years

ULTRASONOGRAPHIC FINDINGS

Chronic pancreatitis versus aging changes. Chronic pancreatitis/triaditis, lymphoma, FIP, IBD.

WEIGHT

8.25 lbs

Enlarged lymph nodes.

Normal echocardiogram.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Consider FNA of the liver +/- lymph nodes and pancreas. The Prednisone may be suppressing a more significant process.

HOSPITAL NAME

SDEP Lab

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
