

## PATIENT

Clipper Evangelista

## SPECIES

Canine

## BREED

Mix

## SEX

Neutered male

## AGE

12 years

## WEIGHT

31.4 lbs

## INTERPRETED BY

Eric Lindquist, DMV  
DABVP, Cert. IVUS

## IMAGING PERFORMED BY

Jenn

## HOSPITAL NAME

Rockaway AH

## REFERRING VET

Dr. Maniar

## INVOICE

68919

## DATE

11/21/25

## PRESENTING CLINICAL SIGNS

History: decreased appetite vomiting, very skinny hair loss  
WBC 17.99 ALT 951 ALP 1936 GGT 62 Lipase >2000

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **left kidney** was swollen, mildly irregular with enhanced surrounding fat. There were pockets of free fluid noted. The left kidney measured 6.04 cm.

An anechoic cyst was noted in the medial aspect of the right kidney. The cyst measured 2.3 cm. The right kidney measured 7.12 cm.

### Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.07 x 0.42 cm at the caudal pole and 0.45 cm at the cranial pole.

### Spleen

The **spleen** was slightly enlarged with scalloping contour. Reactive, enhanced mesentery was noted.

### Liver

The **liver** was swollen and irregular with scalloping contour. Enhanced mesentery was noted. The gallbladder was echogenic and thickened. The common bile duct was unremarkable.

### Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Variable upper small intestinal thickening was also noted. The descending colon was thickened, yet there was no loss of mural detail. The colonic wall thickness measured 0.67 cm. The mesenteric lymph nodes were enlarged.

**DATE**

11/21/25

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**ULTRASONOGRAPHIC FINDINGS**

- Splenohepatomegaly with variable thickened GI tract and lymphadenopathy.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Ultrasound-guided FNA of the spleen and liver is indicated. There is a strong concern for underlying round cell neoplasia versus splenitis and hepatitis.
