WEIGHT

7.6 Pounds

PRESENTING CLINICAL SIGNS

History: Recheck echo from 5/20/22, check abdomen after sx to remove intestinal mass at ICJ. Mass was Leiomyosarcoma.

ULTRASONOGRAPHIC EXAMINATION OF THE HEART & ABDOMEN

CANINE CARDIAC PARAMETERS	MR VMAX (m/s)	TR VMAX (m/s)	LA/AO (Boon method)	LA/AO (Heart Base; Swe)	FS (%)	EF (%)	EPSS (cm)
NORMAL PARAMETER	4.5-5.5	<2.7	1.3	<1.3	28-40	40-100	<0.6
PATIENT	5.11	3.03	1.4	1.47	53	86	0.1
CANINE CARDIAC PARAMETERS	HR (BPM)	AV VMAX (m/s)	PV MAX (m/s)	BODY WEIGHT (kg)	LA 2D short axis Base view (cm)	LVIDd Avg; 2D and m-mode short axis (cm)	LVIDs Avg; 2D and m-mode short axis (cm)
NORMAL PARAMETER	50-100	0.7-1.7	0.7-1.6				
PATIENT	193	1.40	.85	--	2.0	2.44	--

Cardiac Presentation

The cardiac presentation presented essentially similar parameters to the prior sonogram with mitral and tricuspid insufficiency. Contractility and volumes were fairly normal. Slight elevation of the LA/AO ratio and June Boon measurement, however, the more valid measurements are LA max and LA heart base, therefore, this is considered still stage B-1 valvular disease with minor early pulmonary hypertension, not in a treatable range. No overt contraindications to anesthetic procedure.

Urinary System

The urinary bladder, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The kidneys revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some minor age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The right kidney measured 2.9 cm. The left kidney measured 2.9 cm.

Adrenal Glands

PATIENT

Pippa Rae Falconi

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 1.4 cm x 0.68 cm at the cranial pole and 0.4 cm at the caudal pole. The left adrenal gland measured 1.2 cm x 0.35 cm at the cranial pole and 0.36 cm at the caudal pole.

SPECIES

Canine

Spleen

BREED

Chihuahua

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

SEX

Spayed Female

Liver

AGE

8 Years

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

WEIGHT

7.6 Pounds

Gastrointestinal

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

IMAGING PERFORMED BY

Shari Reffi, CVT

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

HOSPITAL NAME

Byram AH

ULTRASONOGRAPHIC FINDINGS

- Normal abdomen- no evidence of pathology
- Stable stage B-1 valvular disease- similar to the prior sonogram with early pulmonary hypertension (not in a treatable range)

REFERRING VET

Dr. Carlos Abdul-Chani

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No return of the prior intestinal pathology evident.

INVOICE

17972

The heart is stable without clinical disease. No overt contraindication for anesthesia of brief to moderate duration. I suggest Torbutrol premed, Propofol induction, Isoflor maintenance or similar protocol if anesthesia is desired. Blood pressure recommended if not already performed and target white coat negative systolic pressure of < 160 mmHg. If higher than this ACE-inhibitor is suggested to reach this level. Recheck echocardiogram is recommended in 6 months, earlier if murmur grade increases or clinical signs initiate.
