

PATIENT

Joey Yannuzzi

PRESENTING CLINICAL SIGNS

re check from yesterday, stomach was full patient was now fasted

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

BREED

Dachshund

The prostate was uniform, measuring 3.0 cm. Slight deviation of the descending colon noted.

SEX

Neutered Male

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 4.32 cm.

AGE

3 Years

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 2.21 cm x 0.53 cm at the caudal pole and 0.71 cm at the cranial pole. The left adrenal gland measured 1.5 cm x 0.37 cm at the caudal pole and 0.52 cm at the cranial pole.

WEIGHT

14.5 Pounds

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

IMAGING PERFORMED BY

Jenn

Liver

HOSPITAL NAME

Rockaway AH

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

REFERRING VET

Dr. Maniar

Gastrointestinal

INVOICE

33132

The **stomach** was filled with soft, progressively shadowing material and delayed outflow pattern. Chyme transit noted within the small intestine with hyperperistalsis.

Pancreas

DATE

12/1/21

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

PATIENT

Joey Yannuzzi

ULTRASONOGRAPHIC FINDINGS

- Soft shadowing gastric material and delayed outflow pattern

SPECIES

Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Induction of vomiting may be effective in this patient. The material appears to be soft. Recheck sonogram post-vomiting. Otherwise, surgical intervention with gastric evacuation would be necessary. The amount of material is fairly small, but appears to be causing mild outflow delay.

BREED

Dachshund

SEX

Neutered Male

AGE

3 Years

WEIGHT

14.5 Pounds
