PRESENTING CLINICAL SIGNS

History: Coco Irizarry- dx'd with atypical hyperadrenocorticism based on endocrine alopecia and Tennessee Adrenal panel. had an abd u/s 9/2/2025 and diagnosed with gall bladder dz. Started Ursodial and supplements for Cushing's (flax lignans etc_ and pet is doing well, hair has come back in, less panting. Came in today for repeat limited scan to assess gallbladder: **ULTRASONOGRAPHIC FINDINGS** · The gallbladder changes could be consistent with cholestasis, fasting or an emerging mucocele. · Bilateral age-related renal changes with non-obstructive nephrolithiasis. *There is no obvious evidence of an adrenal tumor in today's study. **INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS** Given the gall bladder changes, Ursodeoxycholic acid (Ursodiol) is recommended. Serial sonographic monitoring (e.g., every 6-8 weeks) of the gall bladder is recommended to assess for progression to a fully formed mucocele. If progression occurs, a cholecystectomy may be warranted. (edited)

ULTRASONOGRAPHIC EXAMINATION

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The right kidney revealed mineralization. The right kidney measured 4.4 cm.

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The portal vein to vena cava ratio was 1:1. Subjectively the portal vein was prominent. The gallbladder was mildly to over distended with suspended bile. The gallbladder did not present aspects of mucocele formation. Minor suspended debris was noted.

ULTRASONOGRAPHIC FINDINGS

Stable gallbladder, no further aspects of mucocele formation; however, minor excessive over distension and biliary coalescence.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I recommend continuing Ursodiol as a preventative.
