PRESENTING CLINICAL SIGNS

History: • Gastrointestinal stromal tumor (cecal mass) • History of septic abdomen (resolved) • Chronic intermittent gastrointestinal issues Chemo was recommended, O declined. At present time no v/d, doing well at home.

Abnormal PE/Chem/CBC/UA Results: NSF All Wnl

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.9 cm. The right kidney measured 4.03 cm.

The residual prostate measured 0.68 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.48 cm at the caudal pole and 0.42 cm at the cranial pole. The left adrenal gland measured 0.54 cm at the caudal pole and 0.43 cm at the cranial pole.

Spleen

The **spleen** in this patient was mildly enlarged with uniform parenchyma and was folded upon itself cranially and caudally. This is a positional variant and is not pathological. There was no evidence of significant disease.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic

PATIENT

lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Rico Flores

SPECIES

Gastrointestinal

Canine

The **gastrointestinal tract** was largely unremarkable with minor areas of increased submucosal echogenicity and thickening. There was no loss of mural detail. There was no evidence of masses or foreign bodies. Gastrointestinal peristalsis appeared normal.

BREED

Pomeranian

SEX

Pancreas

Neutered male

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

AGE

6 years

WEIGHT

ULTRASONOGRAPHIC FINDINGS

9.4 lbs

Mild chronic GI changes, no evidence of tumor or other pathology.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of recurrence of the prior neoplastic event.
