

PATIENT

Sunne Reid

SPECIES

Canine

BREED

Golden Retriever

SEX

Male

AGE

3 Years

WEIGHT

126 Pounds

INTERPRETED BY

Eric Lindquist, DMV

DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Jenn

HOSPITAL NAME

Rockaway AH

REFERRING VET

Dr. Maniar

INVOICE

43480

DATE

12/15/22

PRESENTING CLINICAL SIGNS

Looking for retained testicles

LIMITED ULTRASONOGRAPHIC EXAMINATION

The urinary bladder, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The prostate was unremarkable at 2.2 cm, uniform. Most consistent with a regressed prostate.

A single still image of an isoechoic structure appeared to be in the iliac region, such as a lymph node, measuring 6.8 cm x 3.0 cm. However, this does not appear to be similar to a retained testicle.

ULTRASONOGRAPHIC FINDINGS

- Normal bladder and urethra with subjectively regressed prostate
- Isoechoic structure in the iliac region – possible lymph node.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of retained testicles. Assessment for neutering scar recommended in this patient to ensure this patient has not already been neutered, as I would expect a larger prostate if this patient were intact. Further imaging and video of the isoechoic structure in the iliac region would be necessary for further evaluation. However, it is likely an angular approach to fat accumulation, as no overt structure is present.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
