

PATIENT

Peanut Ciesla

PRESENTING CLINICAL SIGNS

History: Vomiting / Regurgitation last 24 hours; Painful Abd during exam. On Methimazole

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Domestic Shorthair

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Netuered male

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. Slight mineralization was noted in both kidneys. The left kidney measured 3.0 cm. The right kidney measured 3.0 cm.

AGE

12 years

WEIGHT

16.2 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.4 cm.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

IMAGING PERFORMED BY

Dr. Cerf

HOSPITAL NAME

Veterinary Center of
Hardyston

Liver

The **liver** was slightly swollen and hypoechoic to the surrounding fat. Occasional hypoechoic nodule was noted and measured up to 1.0 cm. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

The **gastroesophageal** inlet in this patient revealed a hypoechoic 2.0 cm x 1.0 cm mass with regional inflammation. The remainder of the stomach and small intestine appeared unremarkable.

DATE

12/16/22

PATIENT

Pancreas

Peanut Ciesla

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

BREED

Gastroesophageal mass with hepatic enlargement.

Domestic Shorthair

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SEX

25-gauge FNA of the mass and liver is recommended for further definition.
