

## PATIENT

Grizabella Yacovone

## SPECIES

Feline

## BREED

Domestic Shorthair

## SEX

Spayed female

## AGE

7 years

## WEIGHT

9.9 lbs

## INTERPRETED BY

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

## IMAGING PERFORMED BY

JK

## HOSPITAL NAME

Hamburg VC

## REFERRING VET

Dr. Branning

## INVOICE

69378

## DATE

12/17/25

## PRESENTING CLINICAL SIGNS

History: 3 lb weight loss, vomiting, lethargic.  
Abnormal PE/Chem/CBC/UA Results: Blood normal

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.73 cm. The right kidney measured 3.73 cm.

### Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

### Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted. The spleen measured 0.9 cm.

### Liver

The **liver** was slightly swollen. The gallbladder and common bile duct were unremarkable.

### Gastrointestinal

The **gastrointestinal** presentation revealed mild uniform prominence of the gastric mucosa as well as areas of "ropey" small intestinal wall. The muscularis layer was hypertrophied inverting the normal ratio (1:3). The intestinal submucosa was slightly irregular, thickened and hyperechoic suggestive of low

## PATIENT

grade, chronic inflammation. The mesenteric lymph node was enlarged and measured 1.5 x 0.67 cm. Larger cluster of lymph nodes were noted in the cranial abdomen measuring up to 2.5 cm. Reactive mesentery was noted around the intestinal tract and lymph nodes. This is indicative of inflammation.

## Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

Intestinal thickening with multi-focal lymphadenopathy. Strong concern for lymphoma.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Ultrasound-guided FNA of the accessible lymph nodes and liver is warranted for further definition. The prognosis is guarded. Severe lymphadenitis and FIP is also a remote potential.
