PRESENTING CLINICAL SIGNS

Vomiting and diarrhea last week lethargic anorexic

Abnormal PE/Chem/CBC/UA Results: ALT Creatine severe elevation Lipase severe elevation Lepto titer taken result pending.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **prostate** was uniform measuring 1.0 cm.

The **kidneys** in this patient presented with mild increased cortical echogenicity with extra capsular hypoechoic fluid accumulation. The left kidney measured 5.26 cm in length. The right kidney measured 5.6 cm in length.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.59 cm width at the cranial pole and 0.60 cm width at the caudal pole.

Spleen

The **spleen** presented mildly enlarged in size and folded upon itself cranially/caudally.

Liver

The **liver** revealed a double layered edematous gallbladder wall. Uniform parenchyma yet subnormal in size with increased portal markings. Mild to moderate amount of remodeling was noted. The portal vein was enlarged with some level of portal hypertension likely causing the mild amount of free fluid noted.

Gastrointestinal

The **gastric** wall presented with thickening measuring 1.24 cm with some loss of mural detail. The small intestine and colon were unremarkable.

Pancreas

The right limb of the **pancreas** presented edematous with mild undulating contour. Hyperechoic fat was noted around the pancreas and suggests for some level of pancreatitis.

ULTRASONOGRAPHIC FINDINGS

- Acute cholangiohepatitis.
- Pancreatitis with pancreatic edema.

PATIENT

Felix Yee

- Severe gastritis with pericapsular renal fluid- strongly suggests for leptospirosis and acute on chronic presentation.
- Double layered gallbladder wall.

SPECIES

Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Plasma expanders/plasma transfusion, IV ampicillin and GI protectants are all indicated. Prognosis is guarded. Recheck sonogram in 72 hours to assess response to therapy.
