

<b>PATIENT</b>	<b>PRESENTING CLINICAL SIGNS</b>
Ginger Dobrovensriy	azotemic, newly diagnosed diabetes mellitus, not eating for 4 days, URI symptoms. Was on azithromycin Abnormal PE/Chem/CBC/UA Results: WBC 31.9, neuts 29.7, lymphs 0.92, monos 1.68, eos 0.02. UA pending.
<b>SPECIES</b>	<b>ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN</b>
Feline	<b>Urinary System</b>
<b>BREED</b>	The <b>urinary bladder</b> , trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 1.0 cm beyond the cystourethral junction.
DLH	
<b>SEX</b>	The <b>kidneys</b> presented a relatively uniform cortical hyperechogenicity when compared to the renal medulla, spleen and liver. No overt masses were noted. Corticomedullary definition was nebulous and the ratio favored the cortex slightly. The ureters were not visible and assumed to be normal. These changes are most consistent with chronic interstitial nephritis yet infiltrative disease could not be entirely ruled out without biopsy though neoplasia is not suspected. A cortical infarct was noted in the cranial pole of the right kidney. The right kidney measured 4.07 cm. The left kidney measured 3.89 cm.
Neutered Male	
<b>AGE</b>	<b>Adrenal Glands</b>
9 Years	Both <b>adrenal glands</b> were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.32 cm. The right adrenal gland measured 0.49 cm.
<b>WEIGHT</b>	
11.2 Pounds	
<b>INTERPRETED BY</b>	<b>Spleen</b>
Eric Lindquist, DMV DABVP, Cert. IVUSS	The <b>spleen</b> presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.
<b>IMAGING PERFORMED BY</b>	<b>Liver</b>
Diane McFadden	The <b>liver</b> images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.
<b>HOSPITAL NAME</b>	<b>Gastrointestinal</b>
Newton Vet Hospital	The <b>stomach</b> was empty. The small intestine and colon were unremarkable.
<b>REFERRING VET</b>	<b>Pancreas</b>
Dr. Kim	The base and limbs of the <b>pancreas</b> were observed to be largely isoechoic to surrounding omental fat. Some parenchymal remodeling, however, with mild deviation from curvilinear normalcy was observed. Pancreatic duct and capsular irregularities were present consistent with age related changes. If pain

**PATIENT**

Ginger Dobrovensriy

upon imaging (+ Murphy sign) was present or if the patient is focally painful in subxyphoid palpation then low-grade smoldering chronic pancreatitis should be suspected.

**ULTRASONOGRAPHIC FINDINGS**

**SPECIES**

Feline

- Chronic interstitial nephrosis pattern with infarct on the right kidney
- Unremarkable abdomen otherwise

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**BREED**

DLH

Supportive care should prove effective. No evidence of foreign matter. Emerging renal failure may be an issue in this patient as the kidneys appear approximately 50-60% compromised.
