

PATIENT PRESENTING CLINICAL SIGNS

Romeo Lockwood re check mesenteric LN

SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Canine Urinary System

The **urinary bladder** appeared subjectively thickened, yet a minimal amount of urine was present at the time of the sonogram.

BREED

Pit Bull

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 6.48 cm. The left kidney measured 6.5 cm.

SEX

Neutered Male

Adrenal Glands

AGE

2 Years

The regions of the **adrenal glands** were unremarkable.

Spleen

WEIGHT

69 Pounds

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

IMAGING PERFORMED BY

Jenn

Gastrointestinal

HOSPITAL NAME

Rockaway AH

The **stomach** was filled with ingesta. The small intestine and colon were unremarkable. Curvilinear patterns were maintained. Transit of chyme appeared to be normal. The mesenteric root was imaged, no evidence of significant lymphadenopathy.

REFERRING VET

Dr. Maniar

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

INVOICE

33600

ULTRASONOGRAPHIC FINDINGS

- Normalized abdomen with full stomach (post-prandial presentation)
- Subjectively resolved mesenteric lymphadenopathy

DATE

12/20/21

PATIENT

Romeo Lockwood

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of pathology.
