

PATIENT

Pumpkin Gergelyi

PRESENTING CLINICAL SIGNS

History: vomiting

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 1.0 cm beyond the cystourethral junction.

BREED

DSH

The **right kidney** was unremarkable. The right kidney measured 3.92 cm.

SEX

Spayed Female

A 4.56 cm x 3.55 cm undifferentiated mass was noted deriving from the **left kidney**. Multifocal areas of mineralization were noted. Regional inflammation noted around the left kidney.

AGE

10 Years

Adrenal Glands

The regions of the **adrenal glands** revealed no evident pathology.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

WEIGHT

7 Lbs.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

The **liver** revealed increased portal markings and a hyperechoic 1 cm microcystic nodule in the right cranial liver consistent with cystadenoma.

IMAGING PERFORMED BY

Jenn

Duplicated **gallbladder** noted in this patient, not pathological.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

HOSPITAL NAME

Rockaway AH

REFERRING VET

Dr. Maniar

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Some mild parenchymal remodeling, however, with mild deviation from curvilinear normalcy was observed. Pancreatic duct and capsular irregularities were present consistent with age related changes. If pain upon imaging (+ Murphy sign) was present or if the patient is focally painful in subxyphoid palpation then low-grade smoldering chronic pancreatitis should be suspected.

INVOICE

13177

ULTRASONOGRAPHIC FINDINGS

- Left renal mass, appears isolated. Regional inflammation noted around the left kidney.

DATE

12/27/21

PATIENT

- Geriatric changes otherwise

Pumpkin Gergely

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Three-view chest radiographs recommended to assess for metastatic disease followed by left nephrectomy.
