

PATIENT PRESENTING CLINICAL SIGNS

Walnut ARLGP

History: Unilateral cryptorchid kitten. Attempted surgery 2 months ago, but unable to locate the undescended testicle. Looking to localize the other testicle before second surgery.
Abnormal PE/Chem/CBC/UA Results: PE: healed well from previous surgery (abdominal incision), L testicle in scrotum. R testicle not palpable.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The left testicle was descended, uniform and measuring 1.68 x 0.92 cm.

The iliac trifurcation was unremarkable.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 3.56 cm. The left kidney measured 3.5 cm.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland was measured 0.28 cm.

IMAGING PERFORMED BY

Dr. Ebersole

Spleen

HOSPITAL NAME

Scanvet

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

REFERRING VET

Dr. Pare

Liver

INVOICE

94376

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT

Walnut ARLGP

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. The mesenteric lymph node measured 1.0 x 0.5 cm.

SPECIES

Feline

BREED

Domestic Shorthair

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SEX

Male

ULTRASONOGRAPHIC FINDINGS

Unremarkable abdomen.

AGE

6 months

Retained testicle was not evident in this patient.

WEIGHT

6 lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

An option is to neuter the descended testicle, which would allow for hypertrophy and further visibility of the retained testicle, inguinal ring and other typical areas. Intraabdominal and extraabdominal areas were thoroughly evaluated. In the visible planes only lymph nodes appeared to be present.
