

PATIENT

Kamakaze Kiel

SPECIES

Canine

BREED

Siberian Husky

SEX

Neutered male

AGE

10 years

WEIGHT

50 lbs

PRESENTING CLINICAL SIGNS

History of horner's syndrome on L. Neuro exam otherwise unremarkable. Hx of hypothyroidism
Abnormal PE/Chem/CBC/UA Results: No evidence of otitis. Thoracic and cervical rads sent to sonopath - cervical rads suspicious for mass effect dorsally deviating trachea. Bloodwork WNL.

ULTRASONOGRAPHIC EXAMINATION

The cervical region in both the right and left approach were taken. The esophagus, trachea and regional tissues were all normal. The carotid was clearly visualized. The visualized portions of the thyroid lobes were unremarkable. Subcutaneous tissue and salivary glands were all normal. There was no evidence of pathology.

ULTRASONOGRAPHIC FINDINGS

No evidence of pathology or space occupying lesions.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Skull positioning on the radiographs should be evaluated. If the head was bent then the trachea may take a natural bend to it; however, reassessment of the cervical radiographs with extended head would be recommended if this was the case.
