

PATIENT

Milo Liszner

PRESENTING CLINICAL SIGNS

Straining to defecate.

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

DSH

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

SEX

Neutered Male

The **kidneys** presented mild interstitial nephrosis pattern with echogenic cortical remodeling and corticomedullary calculi. The right kidney measured 4.8 cm. The left kidney measured 4.9 cm.

AGE

4

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

WEIGHT

19.7

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

INTERPRETED BY

Eric Lindquist, DMV

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

IMAGING PERFORMED BY

Jenn

HOSPITAL NAME

Rockaway AH

Gastrointestinal

The **stomach** revealed hair type density in the gastric lumen. Small intestine and colon were unremarkable. Curvilinear patterns were maintained.

REFERRING VET

Dr. Maniar

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

DATE

2/16/23

ULTRASONOGRAPHIC FINDINGS

- Mild dystrophic renal changes with non-obstructive mineralization
- Minor hairball density in the stomach

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence or colonic disease, yet colorectal pathology and orthopedic pathology should be ruled out.
