PRESENTING CLINICAL SIGNS

- Presents for hematuria, vomiting, diarrhea, lethargy
- Seems to want to eat but nauseous

Abnormal PE/Chem/CBC/UA Results: Mild > GGT Mild thrombocytopenia

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder** was over distended with a mild amount of attached blood clot or possible mass measuring approximately 2.0 cm.

An undifferentiated right renal mass was present with areas of cavitation. The mass measured approximately 10.0 cm. The **right kidney** was not visualized owing to the right renal mass.

The **left kidney** revealed normal size, contour and structure measuring 5.7 cm in length.

Adrenal Glands

Both **adrenal glands** were not visualized.

Spleen

The **spleen** presented slightly enlarged and was folded upon itself. Hyperechoic lipid plaques were present. A 5.0 cm mixed hyperechoic mass was present at the cranial pole of the spleen.

Liver

The **liver** revealed multiple nodules and masses with areas of cavitation. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Free Abdomen

Free fluid was present in the abdomen.

ULTRASONOGRAPHIC FINDINGS

- Multifocal neoplasia involving the spleen, right kidney, liver and potentially the urinary bladder-multicentric sarcoma, likely hemangiosarcoma.
