## PRESENTING CLINICAL SIGNS

Ultrasound bladder due to potential barbering on lower abdomen. Mild sludge noted in bladder. Concerns for uterine stump mass. Uterine stump is bilobed and causing bladder wall to be displaced ventrally. Blood flow noted in mass effect.

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder** revealed a minor amount of suspended and dependent debris. Bladder sand was noted, a grouping of which measured approximately 2.0 cm. The bladder wall itself was unremarkable. The pelvic urethra was imaged 1.0 cm beyond the cystourethral junction.

The **uterine stump** was visualized and unremarkable, measuring 0.48 cm.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex, and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 2.8 cm. The left kidney measured 3.0 cm.

### *Adrenal Glands*

The **adrenal glands** were not visualized.

### *Spleen*

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

### *Liver*

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

### *Gastrointestinal*

A large amount of normal shadowing **gastric** content was present. The small intestine and colon were unremarkable.

### *Pancreas*

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

- Bladder sand and debris, potential UTI
- Large amount of normal shadowing gastric content
- Unremarkable uterine stump

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of uterine stump pathology in this patient. There is a fairly large amount of bladder sand accumulation. The abdomen was unremarkable otherwise.
