PRESENTING CLINICAL SIGNS

Azotemia, weight loss.

Creatinine 4.3, BUN 81.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The left kidney measured 4.5 cm with significant cortical remodeling and irregular contour. Left renal infarcts and multi-focal cortical collapse was noted. There was mild pyelectasia noted. The degenerative changes appeared subjectively near end stage. The right kidney measured 6.5 cm with pyelectasia, irregular contour, thickened cortices and microinfarcts.

Adrenal Glands

The left **adrenal gland** was uniform and measured 2.74 x 0.76 cm. The right adrenal gland was nodular and mildly enlarged measuring 2.78 x 1.58 cm at the cranial pole and 1.25 cm at the caudal pole.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal. No overt evidence of active inflammatory, infiltrative or regenerative pathology was noted but should be paired with current or past LE elevations regarding any clinical significance to this presentation. The hepatic lymph nodes were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

PATIENT

Lady Mandhle

demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

SPECIES

Canine

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Golden

ULTRASONOGRAPHIC FINDINGS

SEX

Spayed Female

Chronic end stage degenerative renal changes. Possible primary dysplasia with secondary degenerative changes and pyelectasia.

Nodular hyperplasia of the right adrenal gland is likely.

AGE

12 years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Urinalysis, culture and sensitivity is recommended along with 72 hour IV fluid protocol and blood pressure measurements are all indicated with reassessment of the azotemia.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS
