

**PATIENT**

Lil Ninja Slaughter

**SPECIES**

Canine

**BREED**

Pekinese

**SEX**

Neutered male

**AGE**

5 years

**WEIGHT**

18 lbs

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Dr. Carter

**HOSPITAL NAME**

Willamette VH

**REFERRING VET**

Dr. Carter

**INVOICE**

42922

**DATE**

2/22/23

**PRESENTING CLINICAL SIGNS**

History: Presented as intact male in November 2022 for hematuria. Suspected prostatitis/prostate hyperplasia. Neutered a week later. Hematuria recurred. Treated with 2 weeks of enrofloxacin. Since then owner reports normal urination and no evidence of blood

Abnormal PE/Chem/CBC/UA Results: US in Dec: he residual prostate exhibited mild prominent size and subtle capsule asymmetry, yet discernable capsule contour compared to adjacent periprostatic tissue. No evidence of periprostatic inflammation. Mild nonhomogenous residual prostatic tissue was noted with a solitary thinly walled cyst containing anechoic fluid. The residual prostate measured 3.4 cm x 2.4 cm. The cyst measured 0.78 cm in diameter. No evidence of parenchymal mineralization. Urine culture was negative

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 3.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The residual prostate was uniform and measured 1.44 cm. There were slight areas of remodeling in the prostatic parenchyma.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities.

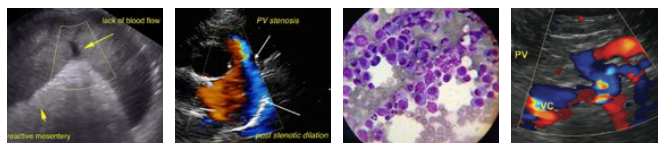

**ULTRASONOGRAPHIC FINDINGS**

Regressed neutered prostate with some remodeling.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The remodeling is likely permanent secondary to pre-neuter prostatic pathology. There was no evidence of masses. If straining to urinate is an issue then traumatic catheterization or FNA is indicated.
