

PATIENT

Snickers Calvanico

PRESENTING CLINICAL SIGNS

PU/PD lethargic.

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

BREED

Domestic Shorthair

The **kidneys** revealed thickened cortices, slight irregular contour and loss of corticomedullary definition. The right kidney measured 4.67 cm. The left kidney measured 4.43 cm.

SEX

Neutered male

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

AGE

8 years

WEIGHT

9.3 lbs

Spleen

The **spleen** revealed multi-focal, hypoechoic nodular changes with a honeycomb type pattern.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

The **liver** was enlarged and heterogenous with hypoechoic nodular changes. The gallbladder and common bile duct were unremarkable. Slight free fluid was noted between the liver lobes.

IMAGING PERFORMED BY

Jenn

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

HOSPITAL NAME

Rockaway AH

REFERRING VET

Dr. Maniar

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

Splenohepatomegaly with thickened, irregular renal cortices.

Slight free fluid.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is a strong concern for multicentric lymphoma, mast cell disease or similar round cell neoplasia. FNA of the spleen and liver are recommended +/- renal cortex for staging. Dry form FIP and granulomatous disease is less likely. Three view chest radiographs are warranted to assess for metastatic changes.
