PRESENTING CLINICAL SIGNS

Presented at our hospital for recheck, inappetence since Monday, when initial seen gave cerenia injection, patient did vomit through the cerenia, lethargic, not acting self, took a while to wake patient up. Very dull/depressed. Has been hospitalized on IVF and NG tube for emptying, NPO. Meds: Buprenex, Cerenia, Ondansetron.

Abnormal PE/Chem/CBC/UA Results: Repeat rads: gastric distention consistently and small amount of radio-opaque material in pylorus area. Concern for FB vs. ileus. Repeat abdominal ultrasound and continued IV fluids/emptying stomach via NG tube. Epoc: wnl, Cortisol 3.2

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction.

The prostate was uniform at 2.0 cm.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex. The capsules were acceptably uniform without significant irregularities. The right kidney measured 7.7 cm with trace pyelectasia noted. The right kidney measured 6.83 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.5 cm. The left adrenal gland measured 0.36 cm.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The spleen folded upon itself cranially. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** was empty, no evidence of residual stasis. Minor transit of chyme noted in the distal small intestine. The colon revealed normal stool consistency.

PATIENT

Pancreas

Simba Molina

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

- Empty stomach, resolved overdistention
- Minor residual chyme transit in the small intestine

BREED

Golden Doodle

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of obstruction, medical management recommended.
