

**PATIENT PRESENTING CLINICAL SIGNS**

Ted Cogliano Thin hair coat.

**SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

**BREED** The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

Ferret

**SEX**

Neutered male The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.18 cm. The right kidney measured 2.7 cm.

**AGE**

3 years

**Adrenal Glands**

**WEIGHT**

2.7 lbs

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.4 cm. The left adrenal gland measured 0.23 cm.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**Spleen**

The **spleen** was folded upon itself caudally.

**IMAGING PERFORMED BY**

Jeanine French

**Liver**

**HOSPITAL NAME**

Fredon AH

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**INVOICE**

**Gastrointestinal**

95803

The **stomach** was filled with progressively shadowing material, ingesta or possible soft foreign matter, hairball accumulation or similar. The shadowing material measured 3.0 cm. Given the patient's history hairball accumulation is suspected. The mesenteric lymph node is normal and measured 2.0 x 0.4 cm.

**DATE**

The cranial abdominal lymph nodes were prominent, yet expected for this breed.

2/3/22

**PATIENT**

**Pancreas**

Ted Cogliano

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

**ULTRASONOGRAPHIC FINDINGS**

**BREED**

Structurally normal adrenal glands.

Ferret

Hairball density in the stomach.

Otherwise, unremarkable abdomen.

**SEX**

Neutered male

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

No specific therapy is recommended.
