DATE

2/3/23

PRESENTING CLINICAL SIGNS

Lost 3 lbs quickly, PICA; cat eating litter, displaying abnormal behavior at home. Current meds: none - R/O gastric outflow impairment vs. other.

Abnormal PE/Chem/CBC/UA Results: RBC 4.83, retics 251.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder** revealed dependent debris and sand, with sand accumulation up to 1.5 cm.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 3.96 cm. The right kidney measured 4.07 cm.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. Gallbladder debris noted.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Other

The subcutaneous space revealed edema pattern that appeared to outside the body wall, consistent with steatitis/cellulitis. FNA, cytology and culture indicated to assess for underlying neoplasia versus cellulitis. Regional lymph nodes also enlarged.

ULTRASONOGRAPHIC FINDINGS

- Normal abdomen with bladder sand and age related renal changes
- Subcutaneous cellulitis pattern

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Cytology and culture indicated. Mild potential for underlying neoplasia such as mast cell. The intraabdominal cavity appeared unremarkable.
