PRESENTING CLINICAL SIGNS

History: Recheck US. Muscle wasting, but maintaining weight. Picky appetite. On Pred-L 10mg SID since last US, stops eating when tries to lower dose. History of idiopathic hypercalcemia and constipation. Uses Miralax prn. Sedated with Alfaxan and Butorphanol.

Abnormal PE/Chem/CBC/UA Results: BW: NSF Prev AUS reports attached.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** were mildly enlarged with conserved architecture. The corticomedullary definition was maintained. The right kidney measured 5.07 cm. The left kidney measured 4.62 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

Spleen

The **spleen** is significantly enlarged and measured 1.17 cm.

Liver

The **right liver** revealed a cyst adenomatous lesion or a mildly complex cyst that measured 2.54 x 1.55 cm. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. Soft stool was noted in the colon.

PATIENT

Pancreas

Bandit Lauze

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Feline

ULTRASONOGRAPHIC FINDINGS

BREED

Domestic Shorthair

Right cranial cystic hepatic lesions, subjectively benign.

Significant splenomegaly.

Enlarged kidneys, yet structurally unremarkable.

SEX

Netuered male

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Given the Prednisone therapy in this patient it is likely suppressing a more significant presentation. Given the mature lymphocytic population in the spleen, small cell lymphoma id a strong potential. PCR or PARR evaluation is recommended if cytology is not definitive.
