**DATE**

3/11/23

**PRESENTING CLINICAL SIGNS**

History: increased ALT and GGT, excessive teeth grinding at home, otherwise NSF

Abnormal PE/Chem/CBC/UA Results: ALT 160 GGT 12

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 5.04 cm. The left kidney measured 5.04 cm.

**Adrenal Glands**

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.83 cm x 0.54 cm at the caudal pole and 0.64 cm at the cranial pole. The right adrenal gland measured 1.83 cm x 0.68 cm at the caudal pole and 0.97 cm at the cranial pole.

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**Liver**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**Gastrointestinal**

Some retention of ingesta was noted in the **stomach**, postprandial type presentation. The small intestine and colon were unremarkable.

**Pancreas**

**PATIENT**

Coco Filomeno

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

Canine

**ULTRASONOGRAPHIC FINDINGS**

- Retention of ingesta, postprandial presentation- no overt foreign matter

**BREED**

Dachshund

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

FNA of the liver is indicated for further definition, yet structurally the liver appears unremarkable. This is likely a reactive hepatopathy.

## Causes of Liver Enzyme Elevation in Dogs and Cats

<http://www.sonopath.com/LiverEnzymes>

Analyte	Dogs	Cats
<p><b>Serum Alkaline Phosphatase (SAP)</b></p> <p>SAP is a specific brush border enzyme in the biliary tree, but is also present in other organs, such as the kidneys, intestines, bones, and placenta. An increase in SAP is caused by cholestasis and is more specific for clinical liver dysfunction in cats than in dogs. An elevation in SAP in dogs may occur in low-grade benign states, such as vacuolar hepatopathy, or can be the result of a significant disease process. Rapid</p>	<ul style="list-style-type: none"> <li>• Primary hepatic cholestasis               <ul style="list-style-type: none"> <li>❖ vacuolar hepatopathy</li> <li>❖ nodular hyperplasia</li> <li>❖ neoplasia</li> <li>❖ endocrinopathy                   <ul style="list-style-type: none"> <li>▪ hyperadrenocorticism</li> <li>▪ diabetes mellitus</li> <li>▪ hypothyroidism</li> </ul> </li> <li>❖ drugs (enzyme induction)</li> <li>❖ hormonal influence</li> <li>❖ chronic hepatitis</li> <li>❖ infectious diseases</li> <li>❖ inflammation</li> <li>❖ toxicity</li> <li>❖ hyperlipidemia</li> <li>❖ reactive hepatopathy incited by other systemic diseases</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Primary hepatic cholestasis               <ul style="list-style-type: none"> <li>❖ hepatic lipidosis</li> <li>❖ inflammatory cholangitis                   <ul style="list-style-type: none"> <li>▪ neutrophilic</li> <li>▪ chronic neutrophilic/lymphoplasmacytic</li> </ul> </li> <li>❖ non-inflammatory parenchymal disease</li> <li>❖ endocrinopathy                   <ul style="list-style-type: none"> <li>▪ diabetes mellitus</li> <li>▪ hyperthyroidism</li> <li>▪ hyperadrenocorticism</li> </ul> </li> <li>❖ neoplasia</li> <li>❖ infectious                   <ul style="list-style-type: none"> <li>▪ bacterial</li> <li>▪ FIP</li> <li>▪ <i>Toxoplasma</i></li> <li>▪ <i>Bartonella</i></li> </ul> </li> </ul> </li> </ul>
