

**PATIENT PRESENTING CLINICAL SIGNS**

Fin Bressi ADR wobbly can't hold urine  
Current meds 225mg SID Ursodiol 250mg 1/2 SID Fluoxetine 10mg SID

**SPECIES** Abnormal PE/Chem/CBC/UA Results: ALT 238 ALP 1817 Tbili 1.0

Canine

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**BREED** *Urinary System*

Terrier Mix The urinary bladder, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

**SEX**

MN

**AGE**

6

The kidneys revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with mild age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 4.78 cm in length. The right kidney measured 4.36 cm in length.

**WEIGHT** *Adrenal Glands*

20.2

Both adrenal glands were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

The left adrenal gland measured 1.9 cm x 0.4 cm caudal x 0.51 cm cranial.

*Spleen*

**IMAGING PERFORMED BY**

Jenn

The spleen presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted. Minor splenic mineralization was noted.

**HOSPITAL NAME**

Rockaway Animal  
Hospital

*Liver*

The liver was uniformly swollen with minor, excessive gallbladder debris and over distension with dependent and suspended bile without evidence of overt mucocele formation. However, excessive sludge was present. The liver presented coarse architecture with mildly increased portal markings and subtle, mixed echogenic changes. This is consistent with vacuolar hepatopathy and some level of remodeling and history of inflammatory component. There was no overt suspicion of neoplasia.

**REFERRING VET**

Dr Maniar

*Gastrointestinal*

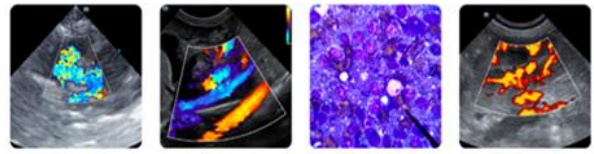

**INVOICE**

24154

Examination of the gastrointestinal tract revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

**DATE**

**PATIENT**

demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Fin Bressi

**Pancreas**

**SPECIES**

The base and limbs of the pancreas were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal, and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Canine

**ULTRASONOGRAPHIC FINDINGS**

**BREED**

- Structurally unremarkable abdomen
- Benign hepatopathy

Terrier Mix

**SEX**

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

MN

Assuming normal clotting status and using a 25g needle, a hepatic FNA for screening cytology could be considered for further definition. No evidence of visceral disease directly related to the clinical signs.
