PRESENTING CLINICAL SIGNS

- Seen 2/26 for not eating well for approximately 10 days, BW revealed elevated ALP
- 2/27 - Started Denamarin and Metronidazole
- 3/12 still very decreased appetite, anorexia some days, Started Prednisone 5mg BID, Cerenia 24mg
- 3/16 o reports eating better since starting steroid and Cerenia
- 3/17 o reports back to anorexia, scheduled ultrasound

Abnormal PE/Chem/CBC/UA Results: 2/26/26 - Elevated ALP 3/18/26 - BW pending

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra to a depth of 2.0 cm presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some mild age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 4.2 cm in length. The right kidney measured 5.1 cm in length.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.50 cm width. The right adrenal gland measured 1.6 cm x 0.66 cm width at the cranial pole and 0.41 cm width at the caudal pole.

Spleen

The **spleen** presented enlarged and folded upon itself cranially/caudally measuring 3.4 cm in width. The spleen revealed an expansive hypoechoic 6.2 cm hepatomatous type mass. Enhanced mesentery and slight free fluid was present associated with the spleen and liver.

Liver

The **liver** presented enlarged, hypoechoic and irregular with expansive swollen irregular contour. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The **pancreas** presented with extensive mixed hypoechoic irregular parenchyma with enhanced mesentery.

ULTRASONOGRAPHIC FINDINGS

- Age-related renal changes.
- Infiltrative splenohepatic pattern- strong concern for round cell neoplasia with variably parenchymal swelling in both organs.
- Concurrent pancreatitis.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

FNA is indicated to assess for round cell neoplasia/lymphoma. Prognosis is guarded pending cytology results.
