

## PATIENT

Goku Reed

## SPECIES

Feline

## BREED

American Longhair

## SEX

Neutered male

## AGE

4 years

## WEIGHT

10.7 lbs

## INTERPRETED BY

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

## PRESENTING CLINICAL SIGNS

- No issues at home
- Cardiac Murmur discovered on examination
- Dental treatment with extractions needed
- PE: Grade II/VI Left heartbase systolic cardiac murmur. Severe erosive lesions requiring multiple dental extractions No current labs

## ULTRASONOGRAPHIC EXAMINATION OF THE HEART

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate LA measurements. The cranial and caudal **mitral** valve leaflets presented normal linear structure and kinetics.. The **left ventricle** presented normal thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions and angles of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinetics. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx.1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted or extra cardiac pathology in the visible planes. The cranial **mediastinum and pericardial regions** were free of masses in the visible window.

## IMAGING PERFORMED BY

Leon Anderson

## HOSPITAL NAME

Elizabeth AH

## REFERRING VET

## ULTRASONOGRAPHIC FINDINGS

Structurally normal heart, likely idiopathic flow murmur.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There was no evidence of hemodynamically pathological changes. There is no contraindication to anesthetic procedure if necessary.

Benign flow murmurs are common in cats. This may be owing to volume shifts, tachycardia, benign (DRVOTO) right ventricular outflow changes, trivial turbulence in any of the valvular apparatuses, or possibly excessive stethoscope pressure against the chest according to a recent study. These are physiologically benign and unrelated to specific pathology.
