PRESENTING CLINICAL SIGNS

History: Vomiting for 2 days with anorexia. R/O gastric foreign body vs. other. Current meds: IVFs, cefazolin, and maropitant.
Abnormal PE/Chem/CBC/UA Results: CBC/Chem: WNL.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The testicles were uniform with no evidence of pathology. The testicles measured approximately 3.2 cm. The prostate was uniform and measured 2.87 cm.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 5.66 cm. The left kidney measured 5.38 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.54 x 0.38 cm at the caudal pole and 0.41 cm at the cranial pole.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT

Yoshi Gledman

Gastrointestinal

SPECIES

Canine

The stomach revealed minor retention of ingesta and chyme in the stomach. Minor fluid filled duodenum was noted. There was no evidence of obstruction. Hyperperistalsis was noted in the stomach. The small intestines and colon were unremarkable. The mesenteric lymph node measured 2.4 x 1.36 cm.

BREED

Goldendoodle

Pancreas

SEX

Intact male

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

AGE

2 ½ years

ULTRASONOGRAPHIC FINDINGS

Gastritis.

Gastroduodenitis pattern.

WEIGHT

39 lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There was no evidence of foreign bodies. Given the patient's age and breed screening for Addison's is warranted. GI protectant protocol, anti-parasitic protocol is all recommended.
