PRESENTING CLINICAL SIGNS

History: Elevated LE found on pre-anesthetic BW in 11/2021. Started on Denamarin. Recheck BW in 2/2022 showed ALP still elevated. No clinical signs of Cushing's at this time.
Abnormal PE/Chem/CBC/UA Results: BW (11/26/2021) ALT 152, ALP 1,921 BW (2/14/2022) ALT 100, ALP 1,746

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 5.7 cm. The left kidney measured 5.16 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.74 cm at the caudal pole and 0.66 cm at the cranial pole. The right adrenal gland measured 1.14 cm at the cranial pole and 0.72 cm at the caudal pole.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** revealed uniform, mild swelling. The hepatic parenchyma was uniform with no significant pathology. Slight coarse architecture and mildly increased portal markings were noted. The gallbladder and common bile duct were unremarkable.

PATIENT

Gastrointestinal

Dunkin Chamberlain

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

SPECIES

Canine

BREED

Jack Russell Terrier
Mix

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SEX

Neutered male

ULTRASONOGRAPHIC FINDINGS

Subjectively benign liver.

AGE

10 years

Minor vacuolar hepatopathy pattern with slight remodeling. There was no evidence of significant disease.

WEIGHT

19.8 lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

FNA of the liver could be considered for further definition, yet the changes are largely expected for this breed and age.
