Feline

BREED

Domestic Shorthair

SEX

Spayed Female

AGE

1 ½ years

WEIGHT

9.6 lbs

PRESENTING CLINICAL SIGNS

History: Khloe presented for a diagnostic cardiac work-up to rule out cardiomyopathy and obtain a baseline for cardiac health. Her owner is concerned because two of Khloe's littermates were diagnosed with cardiomyopathy, although she has had no clinical signs of the condition. She was sedated with 12.9 mg alfaxalone and 0.09 mg buprenorphine IV for the procedure today. Her systolic blood pressure was found to be 180mmHg with the doppler.

ULTRASONOGRAPHIC EXAMINATION OF THE HEART

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate methods of LA evaluation. The cranial and caudal **mitral** valve leaflets presented normal linear structure, extension in systole, and union in diastole with normal kinesis. The **left ventricle** presented thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinesis. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonary outflow** tract assessment revealed normal valve structure, laminar flow, and diameter (approx.1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted. The cranial **mediastinum and pericardial and extra-cardiac regions** were free of masses in the visible window.
