

PATIENT PRESENTING CLINICAL SIGNS

Pebbles Beasley

Presented for 2 day duration of not eating/drinking, lethargy, and possible nausea (lip licking with repeated swallowing). No vomiting. Mainly indoors; goes outside for short periods. UTD on vaccines including FeLV. Not a hunter but does chew on plastic. Physical exam: 5-7% dehydration, grade 2 systolic heart murmur (diagnosed several years ago), tense abdomen.

SPECIES

Feline

Abnormal PE/Chem/CBC/UA Results: Mild neutrophilia (12,384) with mild toxic changes, marked lymphopenia (129, n=1200-8000), mild hyperglycemia (181) with trace glucosuria. FIV/FeLV test pending.

BREED

DSH

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

SEX

Urinary System

Neutered Male

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

AGE

7 Years

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen.

WEIGHT

9.7 Pounds

Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.66 cm. The right kidney measured 3.98 cm.

INTERPRETED BY

Adrenal Glands

Eric Lindquist, DMV

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.41 cm. The right adrenal gland measured 0.42 cm.

DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Spleen

Jenna Walsh, CVT

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

HOSPITAL NAME

Q Street AH

Liver

REFERRING VET

Dr. Cone

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT *Gastrointestinal*

Pebbles Beasley The **stomach** was empty. Reactive mesentery noted around the pyloric outflow. The pylorus was free of evident obstruction and patent. Some spastic small intestine present. Soft stool and/or barium noted in the colon. A reactive colic lymph node was noted, measuring 4.0 mm.

SPECIES
 Feline *Pancreas*

BREED The **pancreas** was hypoechoic and irregular in the left limb. Heterogeneous pancreatic changes noted throughout the pancreatic base.

DSH **ULTRASONOGRAPHIC FINDINGS**

- SEX**
- Pancreatitis presentation
 - Resolving gastroenteritis

Neutered Male

AGE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS
 7 Years No evidence of foreign matter. IV fluid support, 24-hour NPO, broad-spectrum antibiotics, pain management all indicated. No evidence of obstruction.
