

## PATIENT

Jojo Shufeldt

## SPECIES

Canine

## BREED

Chihuahua

## SEX

Spayed Female

## AGE

7 Years 6 Months

## WEIGHT

4.6 pounds

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP(CFM), Cert.  
IVUSS

## IMAGING PERFORMED BY

Megan Wooten

## HOSPITAL NAME

Rondout Valley  
Veterinary Associates

## REFERRING VET

Dr. Kathleen Laux

## INVOICE

## DATE

04/15/26

## PRESENTING CLINICAL SIGNS

Was practicing US while patient was under for a dental with extractions and found incidental finding in the gallbladder, submitting for full US

Abnormal PE/Chem/CBC/UA Results: monocytosis mild hematuria

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra to a depth of 2.0 cm presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.04 cm in length. The right kidney measured 3.26 cm in length.

### Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.16 cm x 0.30 cm width. The right adrenal gland measured 1.38 cm x 0.70 cm width at the cranial pole and 0.55 cm width at the caudal pole.

### Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

### Liver

The **liver** presented mildly subnormal in size with uniform parenchyma. A gallbladder polyp was noted measuring 0.85 cm x 0.70 cm.

### Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

### Pancreas

## PATIENT

Jojo Shufeldt

## SPECIES

Canine

## BREED

Chihuahua

## SEX

Spayed Female

## AGE

7 Years 6 Months

## WEIGHT

4.6 pounds

## INTERPRETED BY

## DATE

04/15/26

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

- Gallbladder polyp- monitor. Polypoid hyperplasia is likely with emerging carcinoma also possible.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recheck sonogram in four to six weeks. If a character change or growth occurrence occurs, then surgical removal is recommended.
