

## PATIENT

Penny Pangaro

## SPECIES

Feline

## BREED

Maine Coon

## SEX

Spayed Female

## AGE

14

## WEIGHT

8.9

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP (CFM), Cert.  
IVUSS

## IMAGING PERFORMED BY

Jenn

## HOSPITAL NAME

Rockaway Animal  
Hospital

## REFERRING VET

Dr. Harrs

## INVOICE

74480

## DATE

4/16/26

## PRESENTING CLINICAL SIGNS

Recheck u/s from 2/14 re check spleen , gastritis Owner reports doing well at home Current meds Methimazole EN diet

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. Right kidney measured 3.24 cm. Left kidney measures 3.36 cm. Slight cortical infarct noted at the dorsal cortex of the left kidney.

### Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

### Spleen

The **spleen** has normalized in this patient, measuring 8.0 mm.

### Liver

The **liver** presented slight increased portal markings with minor coarse architecture. The gallbladder and common bile duct were unremarkable.

### Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

### Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

- Normalized abdomen with stable left renal infarct.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No evidence of pathology.
