

## PATIENT

Suri Saito

## SPECIES

Canine

## BREED

Golden

## SEX

Spayed femlae

## AGE

8 years

## WEIGHT

62.5 lbs

## INTERPRETED BY

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

## IMAGING PERFORMED BY

Laura Klaassen

## HOSPITAL NAME

Animal Care Group of  
Lake Oswego

## REFERRING VET

Dr. Klaassen

## INVOICE

74091

## DATE

4/2/26

## PRESENTING CLINICAL SIGNS

- Last week restless. Few weeks of gagging after eating
- Rads suspected irregularity near stomach/caudal esophagus – superchem, CBC , UA normal

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 5.8 cm. The right kidney measured 5.3 cm.

### *Adrenal Glands*

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.5 cm at the cranial pole and 0.45 cm at the caudal pole. The right adrenal gland measured 0.63 cm at the cranial pole and 0.46 cm at the caudal pole.

### *Spleen*

The **spleen** in this patient was mildly enlarged with uniform parenchyma and was folded upon itself cranially and caudally. This is a positional variant and is not pathological. There was no evidence of significant disease.

### *Liver*

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

## *Gastrointestinal*

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

## *Pancreas*

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

Structurally normal abdomen, no evidence of hiatal hernias or upper GI pathology. However, I cannot rule out a sliding hernia that can occur periodically, yet at the time of the sonogram everything was normal.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Gastroscopy would be indicated if clinical signs persist. Hydrolyzed canned b.i.d. feedings may be appropriate +/- coverage for Helicobacter.
