PRESENTING CLINICAL SIGNS

THIS IS A WORKING DOG AT THE ACADEMI KENNEL. VOMITING (INCLUDING PIECES OF RUBBER) BLOOD IN VOMIT AND IN THE DIARRHEA PER HANDLER. WE SAW FRANK RED WATERY DIARRHEA AND PROFUSE VOMITING (LIQUID, CHUNKY YELLOWISH) IN CLINIC.

Abnormal PE/Chem/CBC/UA Results: CHEM/LYTES/CPL ALL WNL. SLIGHT ELEVATION IN TOTAL SBC COUNT AND NEUTS, OTHERWISE OK. WILL SEND.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 5.3 cm in length. The right kidney measured 7.0 cm in length.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.50 cm width. The right adrenal gland measured 1.0 cm width at the cranial pole and 0.60 cm width at the caudal pole.

Spleen

The **spleen** presented mildly enlarged, uniform and folded upon itself.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed an empty stomach and empty small intestine, however, the transverse descending colon was fluid filled. No overt foreign body obstruction as all of the visible small intestine appears to be empty.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

- Fluid-filled colon- likely enterotoxin or ingestion.
- Enlarged folded spleen.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recommend medical management, 24-hour NPO, treatment for enterotoxins. Recheck sonogram in 24 to 48 hours if clinical signs are persisting and the patient continues to vomit.
