

## PATIENT

Boo Boo Long

## SPECIES

Feline

## BREED

DSH

## SEX

Neutered Male

## AGE

17 Years

## WEIGHT

14.6 pounds

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP(CFM), Cert.  
IVUSS

## IMAGING PERFORMED BY

Dr. Cecelia Fisher

## HOSPITAL NAME

Cape Coral Pet Vet

## REFERRING VET

Dr. Patrick Vickers

## INVOICE

15312

## DATE

04/21/26

## PRESENTING CLINICAL SIGNS

Wellness screen.

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some mild age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 3.7 cm in length. The right kidney measured 3.7 cm in length.

### *Adrenal Glands*

The **left adrenal gland** was visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.40 cm width.

The region of the **right adrenal gland** was imaged with no evident pathology.

### *Spleen*

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

### *Liver*

The **liver** revealed a mixed hypoechoic microcystic nodule measuring 2.5 cm in the mid cranial liver. A separate microcystic nodule was present in the right cranial liver measuring 1.4 cm. The gallbladder and common bile duct were unremarkable. A separate nodular change was noted in the left lateral liver measuring 2.0 cm.

### *Gastrointestinal*

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

### *Pancreas*

## PATIENT

Boo Boo Long

## SPECIES

Feline

## BREED

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## ULTRASONOGRAPHIC FINDINGS

- Microcystic hepatic nodules consistent with biliary cystadenomas- subjectively benign.
- Age-related renal changes.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Geriatric abdomen with no evidence of clinical pathology.
