PRESENTING CLINICAL SIGNS

History: Feeling a little better since last visit. Finished Clavamox course started 3/6/26 for 7 days. Cardiopet ProBNP was normal. Here for recheck CBC/SDMA/UA. Assessment: Renal mass/cyst, UTI, anemia, neutrophilia. CRF. Plan: FAST scan abdomen/bladder: Severe fluid accumulation around the left kidney, difficulty visualizing normal renal tissue on the left; R kidney has hyperechoic center but more normal in appearance. Normal bladder outline. CBC: HCT 25.7 (L), WBC 27.38 (H), Neut 23.36 (H), Mono 1.69 (H). SDMA: 19 (H). UA: sent to Idexx for UA and culture if indicated. Rx: Clavamox refill (80mg/mL) 0.75 mL q12 hr for 14 days or pending specialist rec. Refer to OVRA for ultrasound/options. Prognosis: Poor. Client education: PE findings and referral options. I would like to continue an antibiotic for her to support her however I'm not sure if we are dealing with a cyst or serious infection and would like her to refer to best dx/tx options and prognosis. I'm very concerned for her. We will send out the UA for culture and send records to OVRA. Recheck: 2 weeks/pending OVRA. Plan: pending OVRA. Dr. Janel Montes

ABNORMAL Labwork Values: CBC: HCT 25.7 (L), WBC 27.38 (H), Neut 23.36 (H), Mono 1.69 (H), SDMA: 19 (H), Cystatin B= 638

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction.

The **right kidney** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some mild age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex, and no evidence of pelvic dilation was present. The right kidney measured 3.67 cm.

Subcapsular halo was noted in the **left kidney** with irregular contour and loss of structural detail. There is strong concern for emerging round cell neoplasia/lymphoma. The left kidney measured 3.3 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.45 cm. The left adrenal gland measured 0.28 cm.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** revealed coarse architecture and slight irregular contour. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Free Abdomen

A large **lymph node** mass was noted, occupying the majority of the cranial abdomen, measuring up to 6.0+ cm. Multiple lymph nodes were involved.

ULTRASONOGRAPHIC FINDINGS

- Left renal and mesenteric lymph node neoplastic pattern
- Coarse architecture in the liver with slight irregular contour
- Age-related right renal changes

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

FNA is indicated for further definition with immediate chemotherapeutic intervention. FNA of the left kidney and lymph nodes should prove adequate. If any liver enzyme elevations are present, then FNA is indicated.
