PRESENTING CLINICAL SIGNS

History: sporadic emesis some days many times a day, chronic diarrhea, losing weight. Anorexia for 2 days (owner said)
Amylase 1345 mild high

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

***Files were tripled, enhancing file size and created a slower interpretation.

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 3.2 cm. The right kidney measured 3.5 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.56 cm.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** revealed slightly increased portal markings. There was no evidence of obstruction, history of cholangitis is likely. The hepatic size was mildly excessive. There were no overt masses noted. The gallbladder wall was mildly echogenic.

Gastrointestinal

The **stomach** revealed progressively shadowing luminal material. This is consistent with likely hairball accumulation or other soft foreign matter. The hair density occupied the stomach from the pylorus to the gastroesophageal inlet. Medical management should prove effective. There was some transit of chyme into the small intestine is occurring. The small intestines and colon were unremarkable with normal curvilinear mural patterns and content.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

Hairball density in the stomach.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Medical management is warranted. A recheck sonogram is recommended in 5-7 days to ensure adequate resolution.
