## PRESENTING CLINICAL SIGNS

History: The pet presented with bloody diarrhea and vomiting since yesterday.  
Abnormal PE/Chem/CBC/UA Results: Dehydration 5 % Hematochezia CBC/CHEM --- Leukocytosis, neutrophilia, Elevated HCT 66.2, HGB 24.6, 9.41 Phosphorus 6.2 Hyperglycemia 214 Prolonged PT UTE, PPT 124.3 CPLI --- Normal

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 2.9 cm. The right kidney measured 2.9 cm.

### Adrenal Glands

The **adrenal glands** were not visualized.

### Spleen

The **spleen** in this patient was uniform, yet volume contracted. Hydration status should be assessed.

### Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

### Gastrointestinal

Examination of the **gastrointestinal tract** revealed an unremarkable stomach and small intestine regarding structure. There were minor areas of luminal fluid noted. There was no evidence of obstructive pattern. Curvilinear patterns were retained throughout the gastrointestinal tract. Areas of

hyperperistalsis were noted. This is consistent with response to irritation. The colon was fluid filled. The mesenteric lymph nodes were reactive.

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**ULTRASONOGRAPHIC FINDINGS**

Gastroenteritis, non-specific.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Dietary indiscretion, food intolerance, structurally significant inflammatory bowel or occult parasitism and occult Addison's are all potentials.
