

**PATIENT**

Shadow Gallo

**SPECIES**

Feline

**BREED**

DSH

**SEX**

Spayed Female

**AGE**

7 Years 10 Months

**WEIGHT**

13.34 Pounds

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert IVUS

**IMAGING PERFORMED BY**

Denise Bruno, LVT,  
RDMS

**HOSPITAL NAME**

Brooklyn Heights VH

**REFERRING VET**

Dr. Venezia

**INVOICE**

37190

**DATE**

4/26/22

**PRESENTING CLINICAL SIGNS**

Distended, fluid filled abdomen ? X-rays - suspect intestinal mass Wheezing episodes BW unremarkable Rad + Labs attached

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder** revealed sand accumulation up to 2.0 cm with suspended and dependent debris. The pelvic urethra was imaged 3.0 cm beyond the cystourethral junction. A minor amount of sand was noted in the deep pelvic urethra, non-obstructive.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 3.93 cm. The left kidney measured 3.93 cm.

**Adrenal Glands**

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.55 cm. The left adrenal gland measured 0.32 cm.

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**Liver**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**Gastrointestinal**

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**ULTRASONOGRAPHIC FINDINGS**

- Bladder and urethral sand, unremarkable abdomen otherwise

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

No evidence of pathology. Medical management for bladder sediment and sand based on urinalysis could be considered, or direct cystotomy with bladder lavage. IV fluid push could be considered to help dissolve the bladder sand and recheck sonogram after 48 hours of fluid therapy. Treatment for any evidence of UTI would be indicated.
