PRESENTING CLINICAL SIGNS

History: Unilaterally cryptorchid, however castrated on one side. Searching for the other testicle via ultrasound.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The left testicle measured 1.19 x 0.73 cm. The testicle was retained in the extraabdominal inguinal region. The testicle is approximately 2.0 cm deep into inguinal fat and approximately 2.0 cm caudal from the cystourethral junction. The intraabdominal presentation was unremarkable.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 4.56 cm. The left kidney measured 4.06 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.32 cm. The left adrenal gland measured 0.25 cm.

Spleen

The **spleen** was at the upper limits of normal. This may be owing to sedation and measured 1.1 cm.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder was duplicated.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

PATIENT

Pancreas

Poe Ravenclaw
Martinez

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Feline

ULTRASONOGRAPHIC FINDINGS

BREED

Minor splenic enlargement.

Domestic Shorthair

Duplicated gallbladder.

Left extraabdominal inguinal retained testicle.

SEX

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Partial Neutered male

Surgical removal from an inguinal approach is recommended. FNA of the spleen is recommended if there is any weight loss.
